Comfort and Learning

- **We need**
  - **oxygen**
  - **short breaks every 45 minutes**
  - **physical exercise after class**
    - **Run, walk, gym, cycle, etc.**

Javaspecialists.eu

Javaspecialists.eu

Questions

- There are some stupid questions
  - They are the ones we did not ask
  - Once we have asked them, they are not stupid anymore
- The more we ask, the more everyone learns

Javaspecialists.eu

Exercises

- We don't learn how to cycle from lectures
- After each lecture, we do exercises
  - During exercises, real learning takes place
  - 50% of time spent applying our knowledge
- We give you hints and solutions
  - Our exercises also have solutions
    - masteringthreads.ch2_basics_of_threads.exercise_2_1
    - masteringthreads.ch2_basics_of_threads.solution_2_1
  - Do not look at the solutions until you have tried yourself

2: Basics of Threads

Multiple Processes

- In the past, machines had a single CPU
  - Programs seemed to run at the same time
    - Word, Excel, Firefox, Chrome, Limewire
- Illusion; our O/S swapped between processes very quickly
- Each process typically ran in its own memory space
  - Inter-process communication expensive

Javaspecialists.eu

Javaspecialists.eu

Why use threads?

- Threads are like lightweight processes
  - share the same memory space
- Scheduler fast at swapping between threads
- In a multi-core machine, threads can improve performance if algorithms are structured correctly
- In a single-core, single processor machine, threads are useful to simplify coding

Javaspecialists.eu

Threading Models

- **Preemptive multithreading (Native Threads)**
  - Operating system forces a context switch
  - Threads can be swapped out at inconvenient time
- **Cooperative multithreading (Green Threads)**
  - Threads give up control at a stopping point (yield, sleep, wait)
  - Infinite loops might never give up control
- **Which One?**
  - Preemptive (native) is safer
  - In modern JDKs, preemptive is used
  - With Project Loom and fibers (Java 12+), moving back to cooperative model

Javaspecialists.eu

Parallel Computing

- Solving a problem on many CPUs in parallel
  - Large problem is broken into smaller ones
  - These are then solved in parallel on multiple cores
  - Focus is on solving problems faster
  - Communication overhead reduces speedup possibilities
- Typically used on large number of cores
  - E.g. few threads per core
- Examples:
  - Weather prediction, financial trend analysis, code cracking

Javaspecialists.eu

Concurrent Computing

- Interacting tasks may execute in parallel
  - Independent tasks simplify architecture
  - Usually not processor intensive
  - Do something useful during wait time (IO, Locks, etc.)
  - Focus on interaction between tasks (memory integrity, progress)
  - Does not always scale well
- Can be used on any number of cores
- Examples:
  - Blocking IO, Swing progress bars, background tasks

Javaspecialists.eu

Java Memory Model (JSR 133)

- Describes shared Java memory behaviour
- Minimum requirement of what must happen
- Allows JVM implementors some freedom
- A correctly written multi-threaded Java application will be correct on every available Java VM
  - A correctly running Java application on one JVM could still be incorrect if it breaks JMM laws
- More detail in next section

Javaspecialists.eu

Creating New Thread

- **Simply override the Thread class**

```
public class MyThread extends Thread {
  public void run() {
    // your concurrent task here
  }
}
```

- **Make instance of MyThread and call start()**

```
var thread = new MyThread();
thread.start();
```

  - **The start( ) method performs initialization, then calls run( )**

- **When run( ) exits, the thread automatically dies**

  - **Threads can only be stopped by them leaving run()**

New Thread with Runnable

- **We can also pass in a Runnable lambda**

```
var thread = new Thread(() -> {
  // your concurrent task here
});
thread.start();
```

Javaspecialists.eu

Javaspecialists.eu

ThreadGroups

- Threads always belong to a group
- Should've used composite design pattern
  - Groups can contain threads and other groups
- Used to partition threads

ThreadGroups

- **What can you do with ThreadGroups?**
  - **Interrupt or stop all threads in a** ThreadGroup
  - **Handle uncaught exceptions**
- **Construct a new ThreadGroup**
  - **By default the current thread's group is the parent**

```
var group = new ThreadGroup("mygroup");
```

  - **Construct your thread using that group**

```
var myThread = new Thread(group, "mythread");
```

Javaspecialists.eu

Shared Memory with Multithreading

- How can two threads access one object?
  - Add & withdraw from bank account
  - IO at the same time, etc.
- If several threads access a memory location at the same time, we will get *race conditions*

Javaspecialists.eu

Javaspecialists.eu

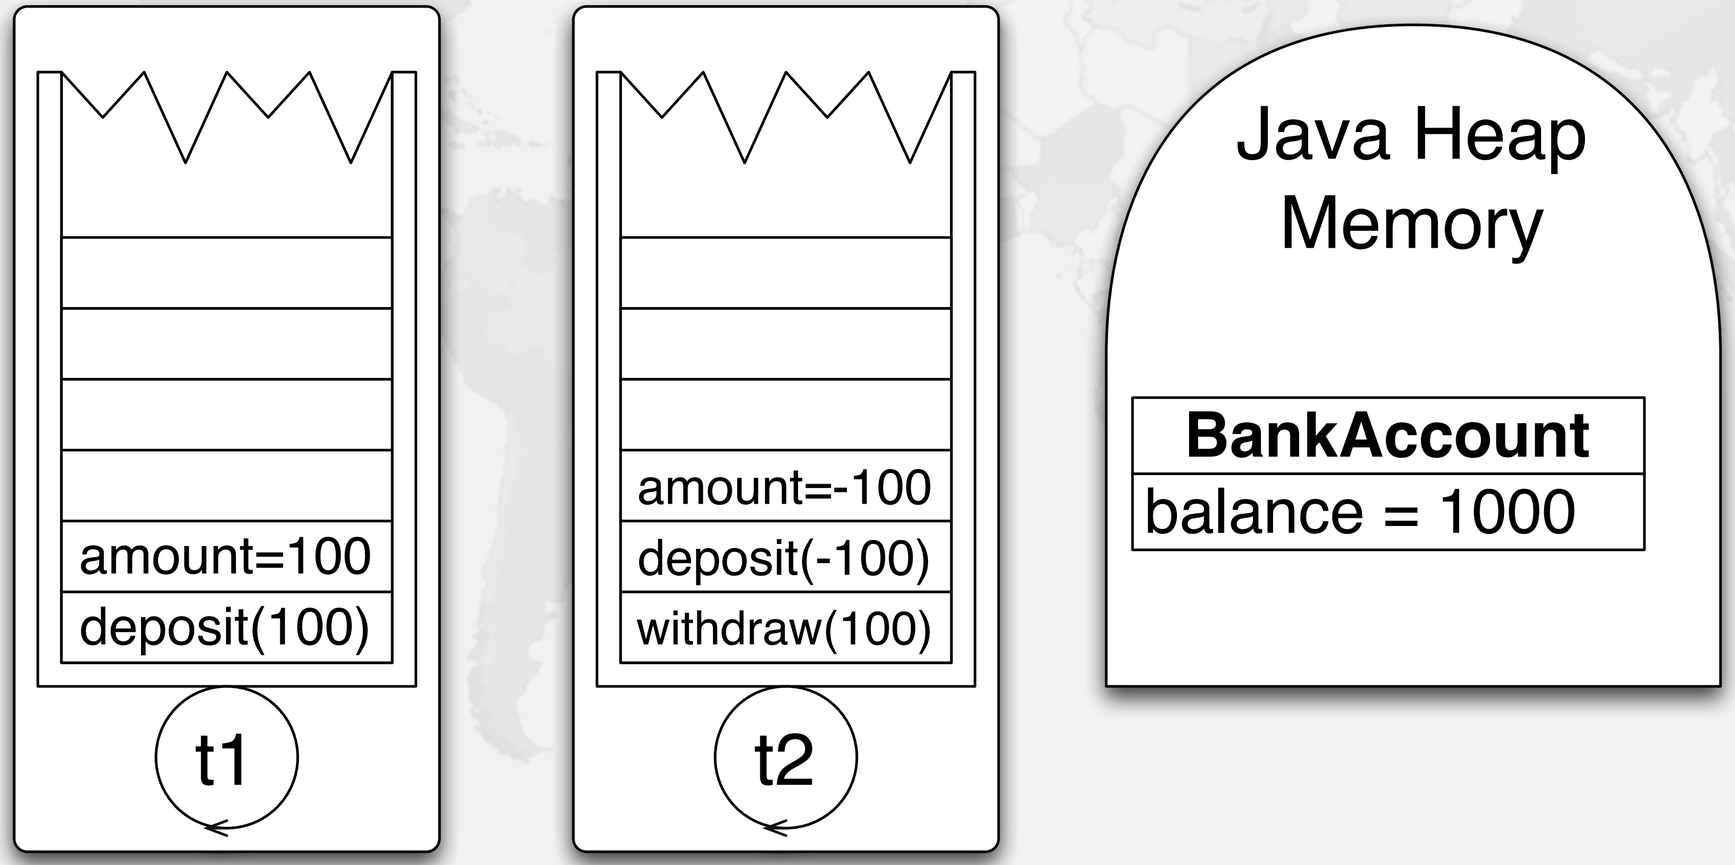
BankAccount Example

```
public class BankAccount {
  private double balance;
  public BankAccount(double initial) {
    balance = initial;
  }
  public void deposit(double amount) {
    balance = balance + amount;
  }
  public void withdraw(double amount) {
    deposit(-amount);
  }
}
```

Javaspecialists.eu

Demo of Race Condition

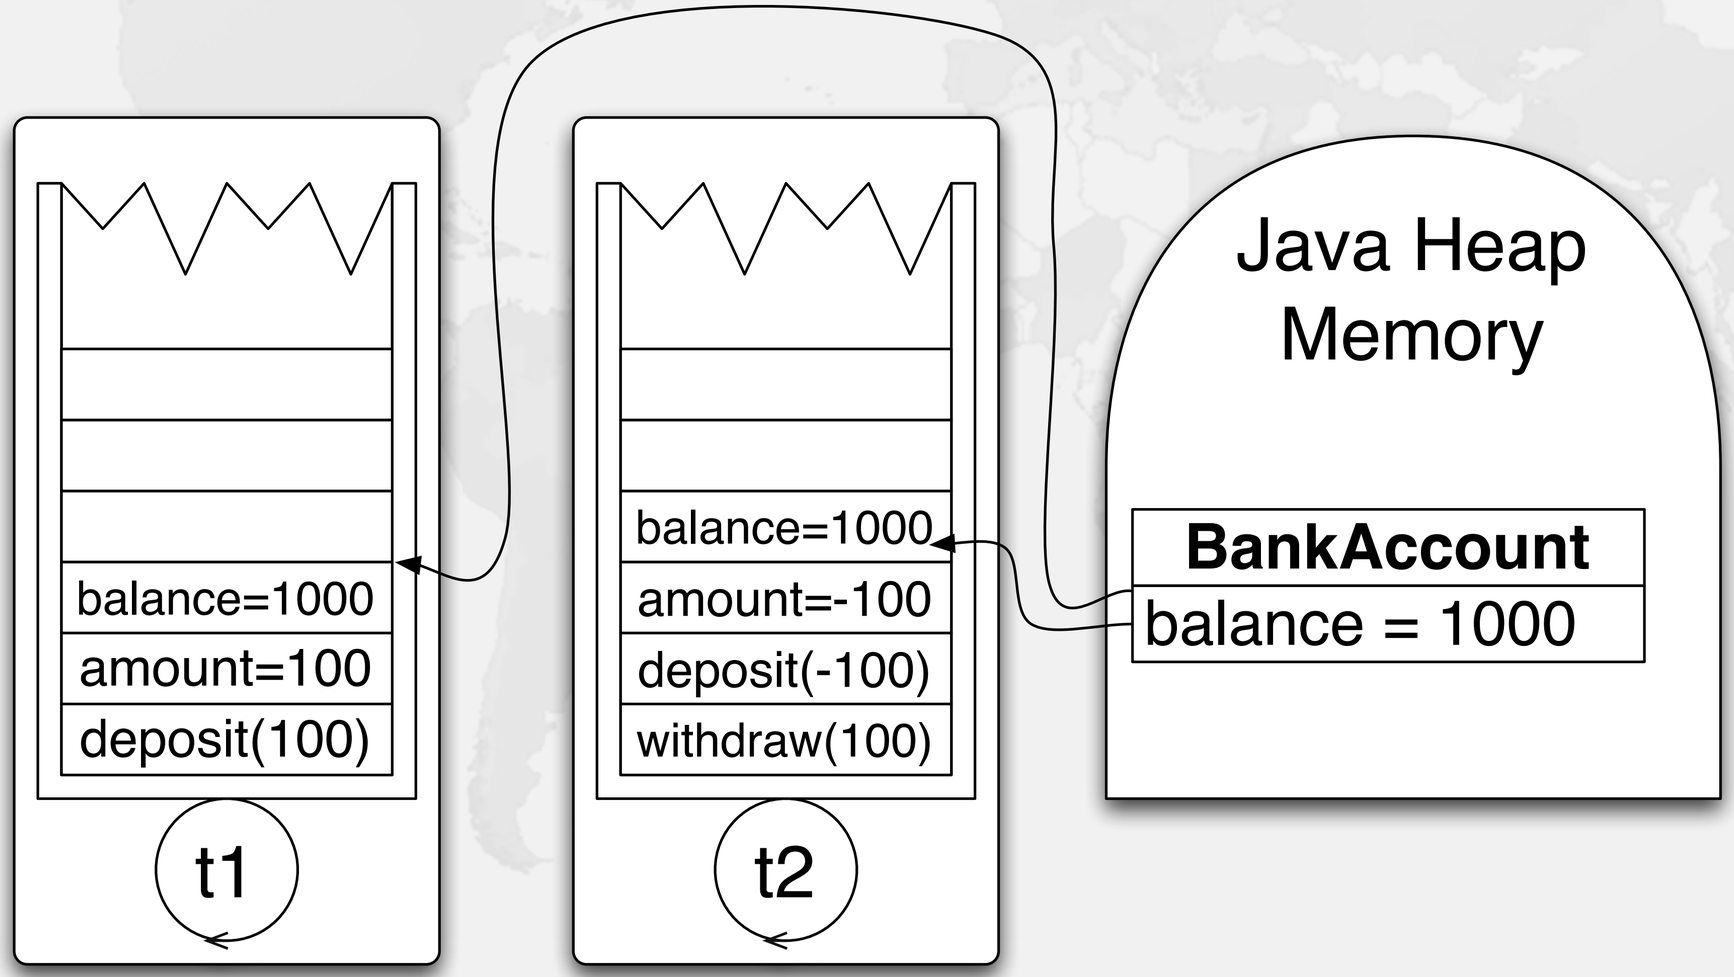
- **t1 calls deposit(100), t2 calls withdraw(100)**
  - **This happens at the same time**



Javaspecialists.eu

Demo of Race Condition

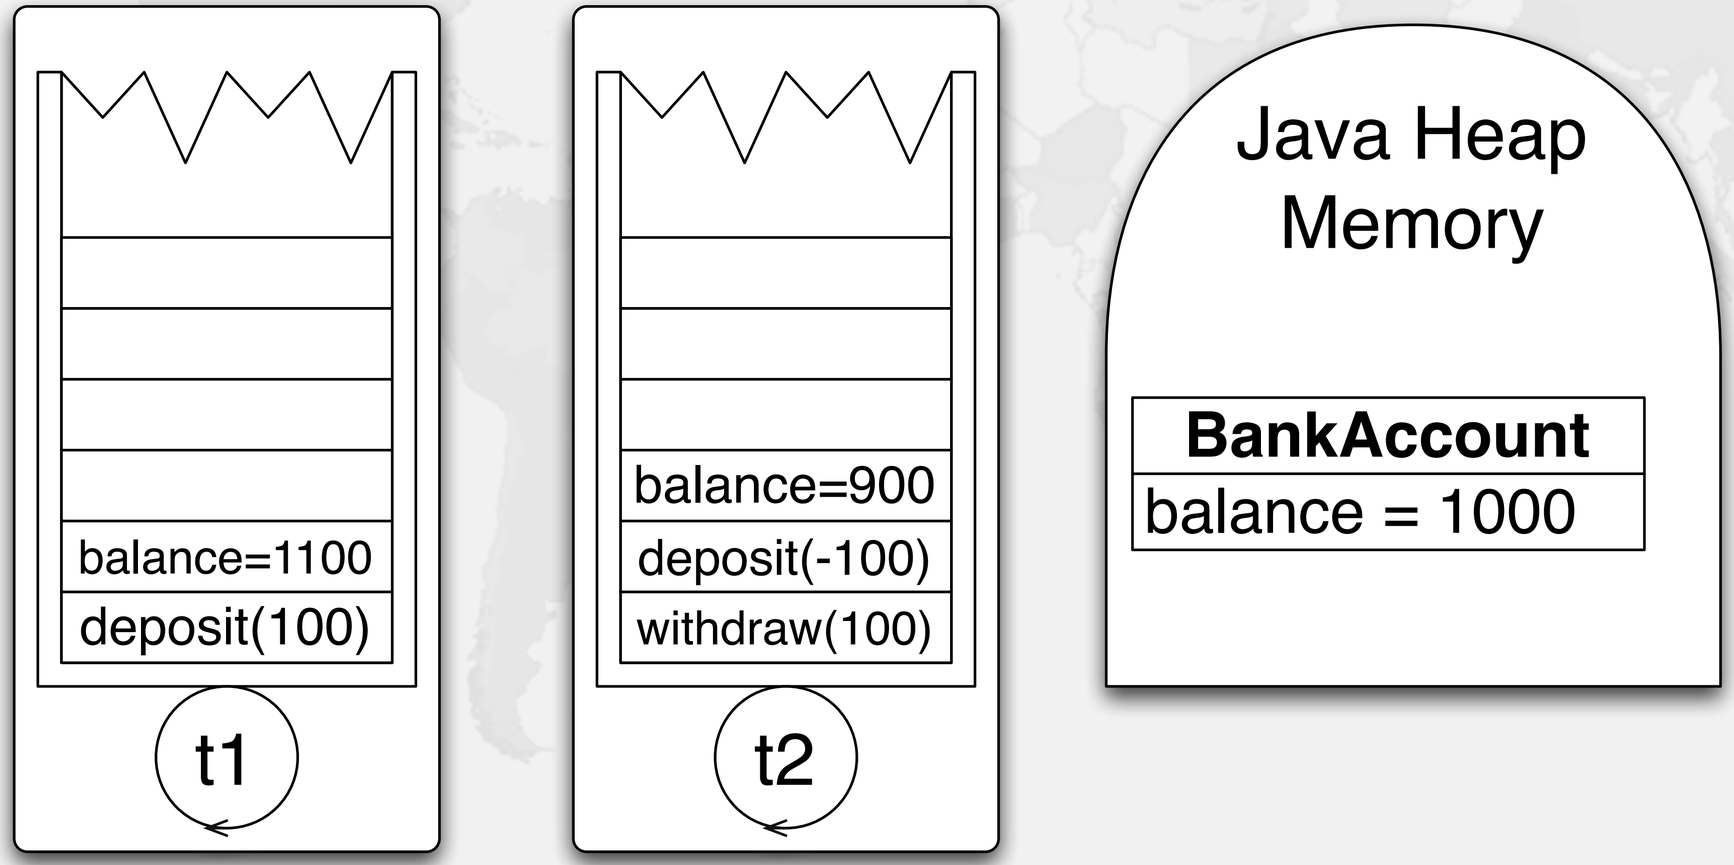
- **Both t1 and t2 read the current balance**



Javaspecialists.eu

Demo of Race Condition

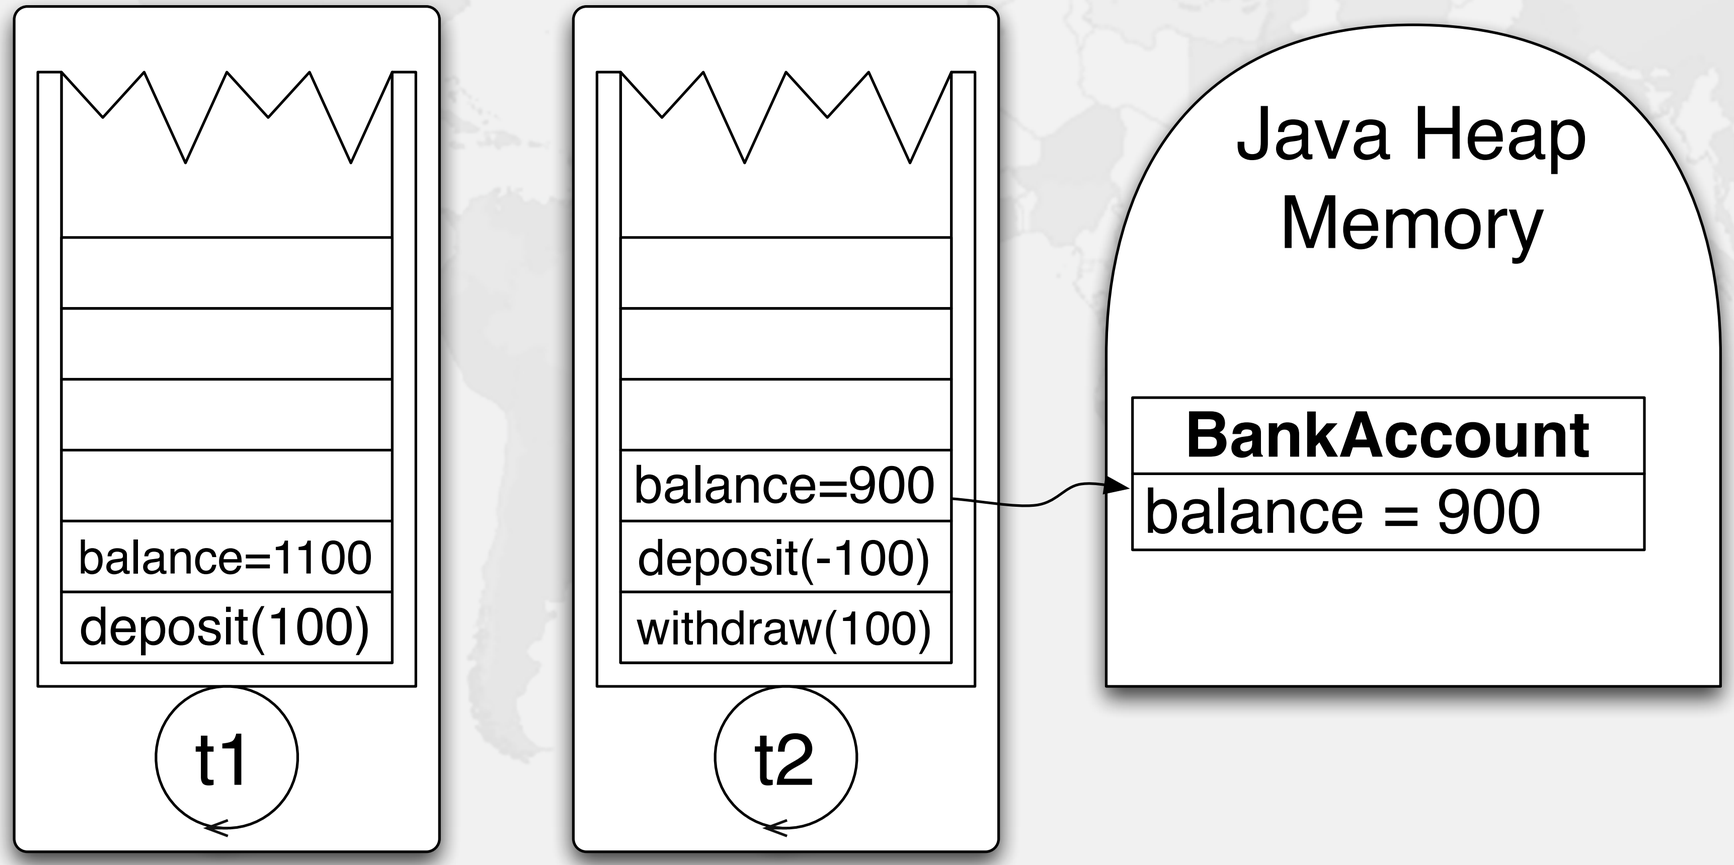
- **Both sum the last two values on the stack**
  - **t1 now sees balance as 1100, t2 sees it as 900**



Javaspecialists.eu

Demo of Race Condition

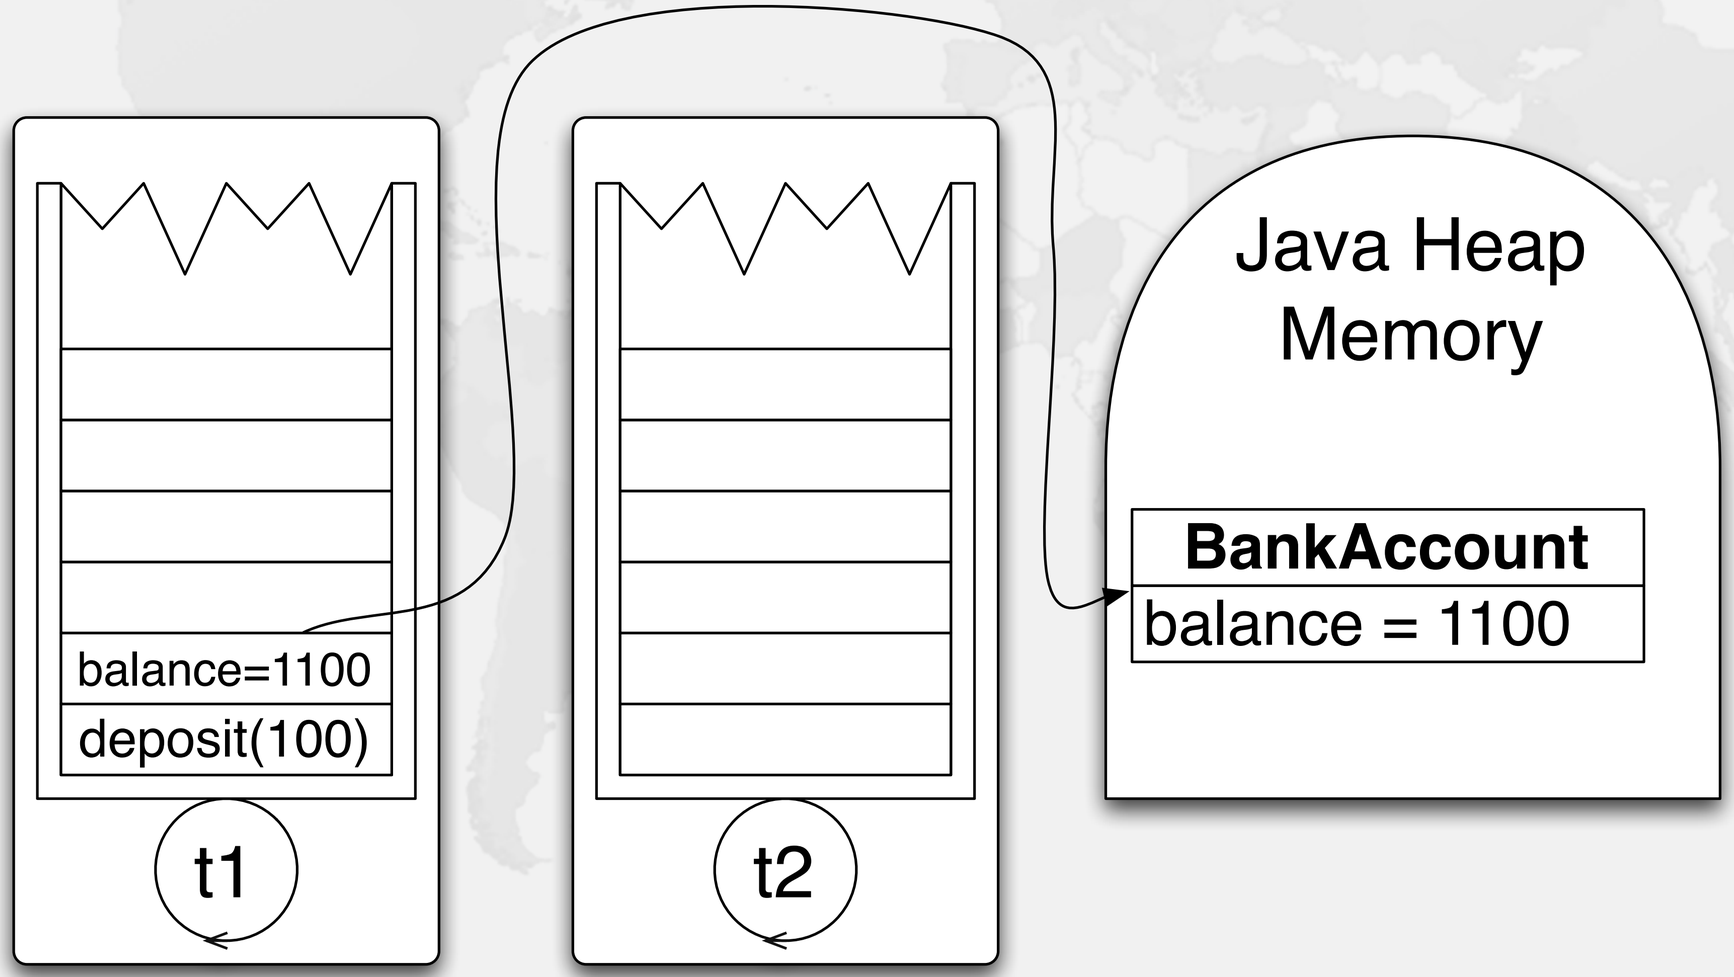
- **Result is unpredictable - race condition**
  - **For example, t2 writes the balance field first**



Javaspecialists.eu

Demo of Race Condition

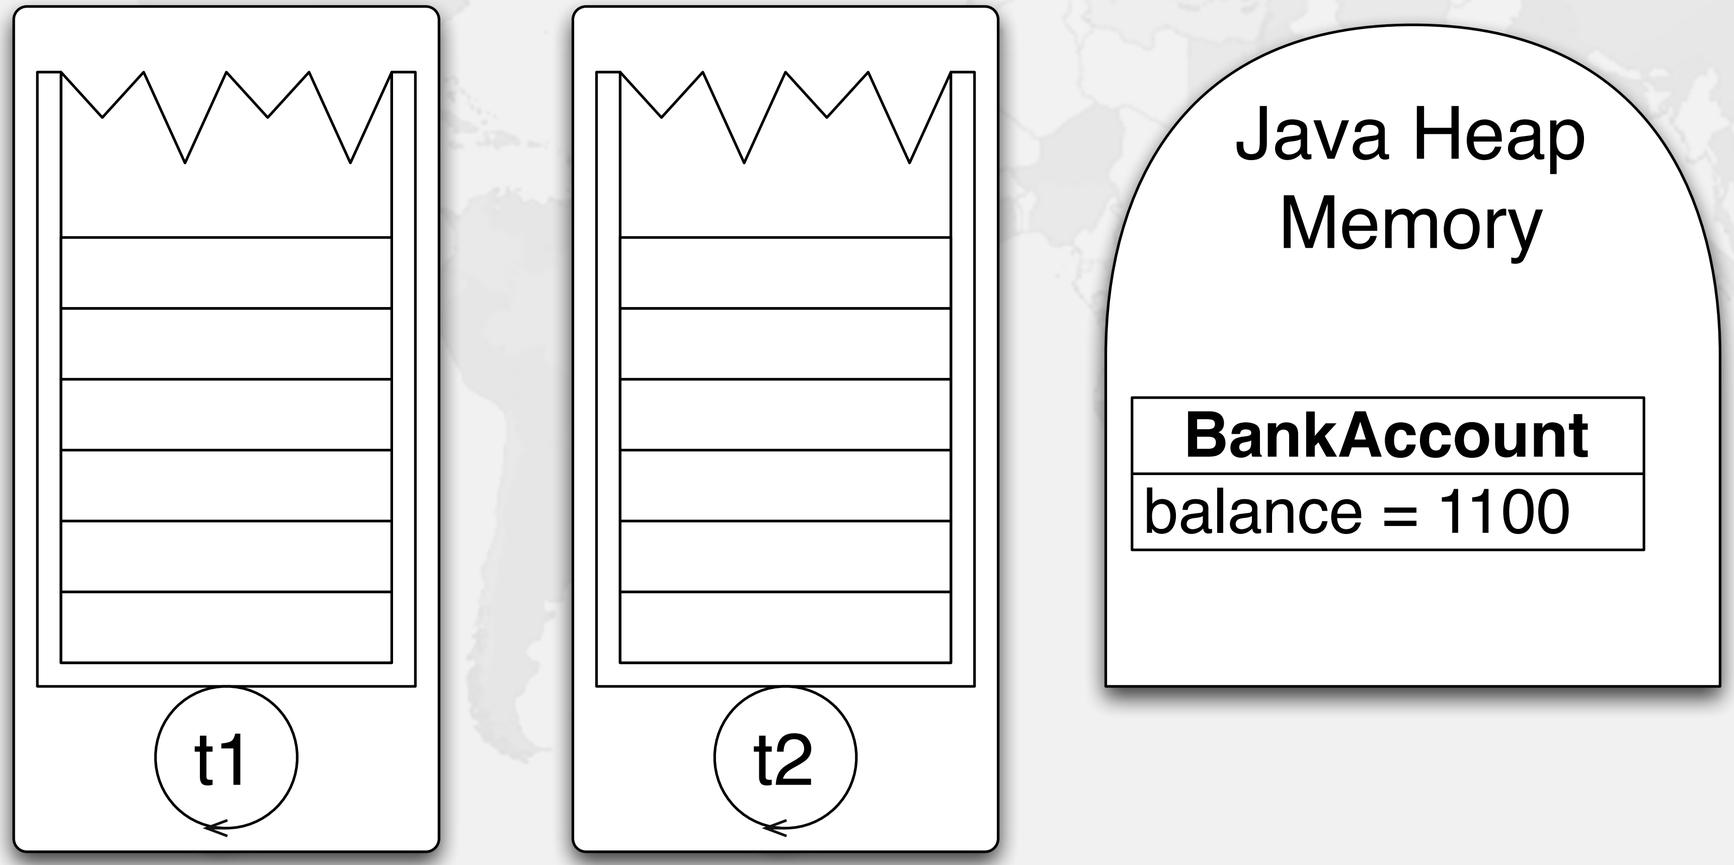
- **Balance is overwritten by t1, so is 1100!**



Javaspecialists.eu

Result of Demo

- **BankAccount balance now is 1100**
  - **We called deposit(100) *and* withdraw(100)**



Race Conditions are Unpredictable

- Anything can happen
- Without synchronization, balance can be:
  - 1000 - what we want
  - 1100 - the withdraw() result was overwritten by deposit()
  - 900 - the deposit() result was overwritten by withdraw()
  - Both 900 and 1100 - each thread sees his own result
  - Neither - if field is a numeric 64-bit type - more in next section

Javaspecialists.eu

Javaspecialists.eu

Synchronized

- **Built-in mechanism for thread safety**
- **Each Java object can be used as a monitor**
- **Only one thread at a time can acquire the monitor with** synchronized
- **No back-off strategy to give up waiting for** synchronized

Javaspecialists.eu

Synchronized BankAccount

```
public class BankAccount {
  private final Object monitor = new Object();
  private double balance;
  public BankAccount(double initial) {
    balance = initial;
  }
  public void deposit(double amount) {
    synchronized(monitor) {
      balance = balance + amount;
    }
  }
  public void withdraw(double amount) {
    deposit(-amount);
  }
}
```

Synchronized Methods

- **We can also synchronize the entire method**
  - **Same as synchronizing on "this"**

```
public synchronized void deposit(double amount) {
  balance = balance + amount;
}
```

Javaspecialists.eu

Synchronized Methods vs "this"

- **What are the differences and similarities?**

```
public void deposit(double amount) {
  synchronized (this) {
    balance = balance + amount;
  }
}

public synchronized void deposit(double amount) {
  balance = balance + amount;
}
```

Javaspecialists.eu

Javaspecialists.eu

Synchronized Static Methods

- **Synchronized static method locks on class**

```
public class Singleton {
  private static Singleton instance;
  private Singleton() {}
  public static synchronized Singleton getInstance() {
    if (instance == null) instance = new Singleton();
    return instance;
  }
}
```

- **getInstance() could also be written like this**

```
  public static Singleton getInstance() {
    synchronized (Singleton.class) {
      if (instance == null) instance = new Singleton();
      return instance;
    }
  }
```

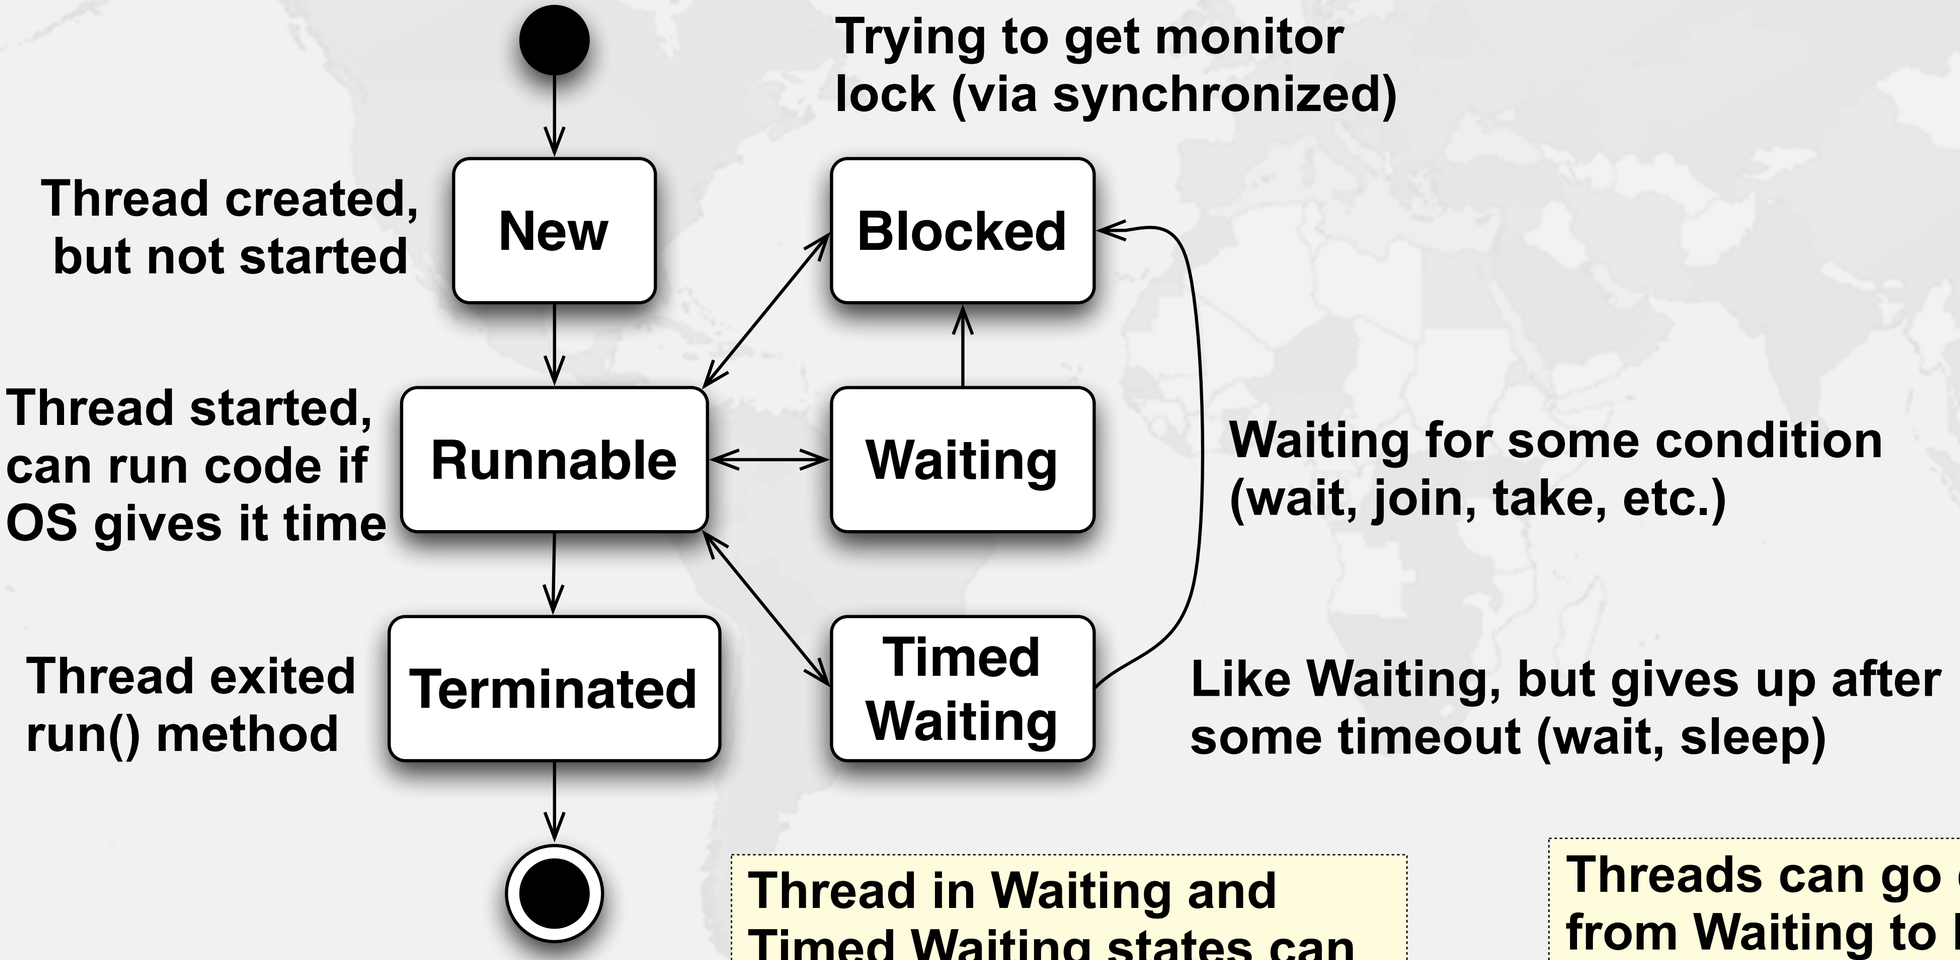
Locking on this vs. private lock

- Synchronized methods break encapsulation
  - Impossible to change locking strategy later
  - Other code could use your object as a lock
- With lock splitting we lock unrelated fields with different locks
  - e.g. methods changeAddress and printAddress in a class BankAccount should be synchronized but don't need to be synchronized in respect to balance updating.
- Easier to understand the concepts of locking if you are locking on a specific object instance

Javaspecialists.eu

Javaspecialists.eu

Thread States



Thread in Waiting and Timed Waiting states can usually be interrupted.

Threads can go directly from Waiting to Blocked if exiting from wait()

Inter-thread Communication

- Threads often need to wait for other threads
  - For example, a queue might be empty
  - Instead of giving up we tell the thread to wait()
- When the resource becomes available, we notify() waiting thread

Javaspecialists.eu

Javaspecialists.eu

Wait & Notify

- **Basic inter-thread communication**
  - `lock.wait()` **releases the object lock and waits**
  - `lock.notify()` **sends a message to one thread**
  - `lock.notifyAll()` **sends a message to all waiting threads**
- **Prefer notifyAll() over notify()**
- **Always write your wait() code so it would also work with notifyAll()**
  - **while(!precondition) lock.wait();**
  - **Also caters for case where we lose the race for the lock**

Javaspecialists.eu

```
public class ProducerConsumer {
  private final List<Runnable> tasks = new LinkedList<>();

  public ProducerConsumer() {
    var thread = new Thread(() -> {
      try {
        while (true) take().run();
      } catch (InterruptedException ignore) { }
    });
    thread.setDaemon(true);
    thread.start();
  }

  private Runnable take() throws InterruptedException {
    synchronized (tasks) {
      while (tasks.isEmpty()) tasks.wait();
      return tasks.remove(0);
    }
  }

  public void submit(Runnable task) {
    synchronized (tasks) {
      tasks.add(task);
      tasks.notifyAll();
    }
  }
}
```

Priorities

- Threads can have different priorities
  - Thread.MIN_PRIORITY = 1
  - Thread.NORM_PRIORITY = 5
  - Thread.MAX_PRIORITY = 10
- Thread priority cannot exceed thread group priority
- Caveat: Thread priority cannot be relied on
  - It might be ignored by JVM or underlying operating system

Javaspecialists.eu

Javaspecialists.eu

Timers

- We want to minimize number of threads
- For periodic tasks use `java.util.Timer`
  - One Timer thread executes lots of tasks
  - Uses less threads in system
- Do not let exceptions bubble up past your `TimerTask.run()`

```
var task = new TimerTask() {
  public void run() {
    System.out.println(new Date());
  }
};
var timer = new Timer();
timer.schedule(task, 1000, 1000);
```

Daemon Threads

- **JVM runs until all non-daemon threads exit**
- **Call** `setDaemon(true)` **before** `start()`

```
var t = new Thread(task);
t.setDaemon(true);
t.start();
```

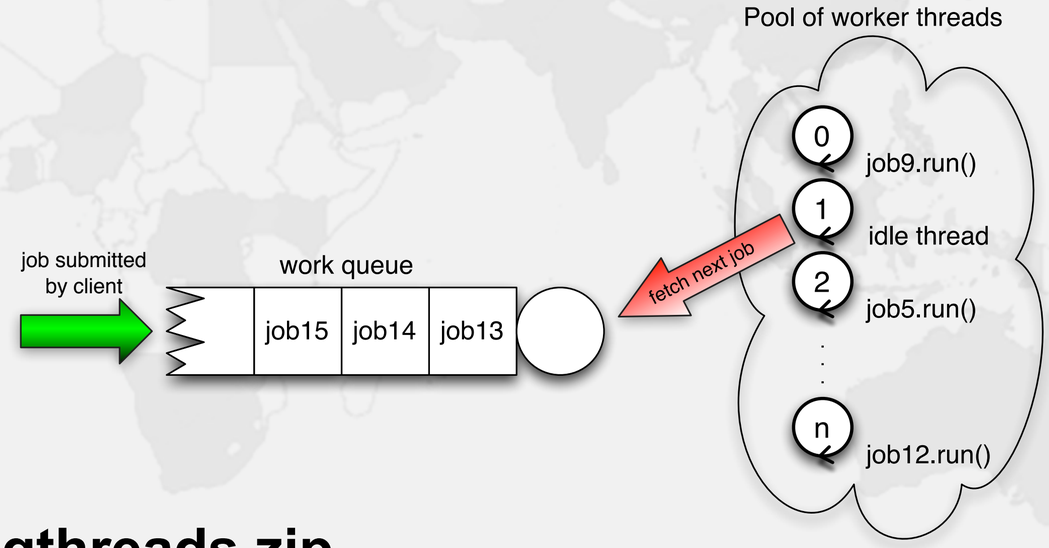
2: Exercises

Basics of Threads

Javaspecialists.eu
java training

Exercise 2.1: Thread Pool

- **Create your own ThreadPool, using**
  - **ThreadGroup**
    - **To shut down all the threads with stop()**
  - **wait/notifyAll**
  - **Must have this functionality:**
    - **Submit a Runnable asynchronously**
    - **Configurable fixed pool size**
    - **Shut down using group.stop()**
    - **Method for viewing run queue length**
    - **www.javaspecialists.eu/outgoing/masteringthreads.zip**



Javaspecialists.eu

Javaspecialists.eu

Exercise 2.2: Priorities

- Construct one thread for each priority
  - This experiment works well on Windows
  - Mac OS X and Linux give all threads same priority
- Wait until they have all been started, then start them all off at the same time
  - Or as closely to the same time as possible
- Give them each equal amount of work to do and measure how fast they complete

3: The Secrets of Concurrency

Javaspecialists.eu

3: The Secrets of Concurrency

- **Writing correct concurrent code is hard**
  - **Only *perfect* is good enough**
- **You need to synchronize in correct places**
  - **Too much synchronization and you risk deadlock and contention**
  - **Too little synchronization and you risk seeing early writes, corrupt data, race conditions and stale local copies of fields**
- **In this section, we will look at ten laws that will make it easier for you to write correct thread-safe code.**

Javaspecialists.eu

The Secrets of Concurrency

- Ten laws to help us write thread-safe code
  - Law 1: The Law of the Sabotaged Doorbell
  - Law 2: The Law of the Distracted Spearfisherman
  - Law 3: The Law of the Overstocked Haberdashery
  - Law 4: The Law of the Blind Spot
  - Law 5: The Law of the Leaked Memo
  - Law 6: The Law of the Corrupt Politician
  - Law 7: The Law of the Micromanager
  - Law 8: The Law of Cretan Driving
  - Law 9: The Law of Sudden Riches
  - Law 10: The Law of the Uneaten Lutefisk

Javaspecialists.eu

1. The Law of the Sabotaged Doorbell

Instead of arbitrarily suppressing interruptions, manage them better.

*** Removing the batteries from your doorbell to avoid hawkers also shuts out people that you want to have as visitors**

Law 1: Sabotaged Doorbell

- **Have you ever seen code like this?**

```
try {
  Thread.sleep(1000);
} catch(InterruptedException ex) {
  // this won't happen here
}
```

- **We will answer the following questions:**
  - **What does InterruptedException mean?**
  - **How should we handle it?**

Javaspecialists.eu

Shutting Down Threads

- **Shutdown threads when they are inactive**
  - **In WAITING or TIMED_WAITING states:**
    - **Thread.sleep()**
    - **BlockingQueue.take()**
    - **Semaphore.acquire()**
    - **wait()**
    - **join()**

Javaspecialists.eu

Thread “interrupted” Status

- **You can interrupt a thread with:**
  - `someThread.interrupt();`
  - **Sets the “interrupted” status to** `true`
  - **What else?**
    - **If thread is in state WAITING or TIMED_WAITING, the thread immediately returns by throwing InterruptedException and sets “interrupted” status back to** `false`
    - **Else, the thread does nothing else. In this case,** `someThread.isInterrupted()` **will return** `true`
- **Beware of** `Thread.interrupted()` **side effect**

Javaspecialists.eu

Javaspecialists.eu

InterruptedException Approaches

- Option 1: Simply re-throw exception
  - Approach used by java.util.concurrent
  - Not always possible if we are overriding a method
- Option 2: Catch and return without throwing InterruptedException
  - Best to return in "interrupted" state
  - Add a boolean volatile field as backup mechanism if calling alien code

```
while (running) {
  // do something
  try {
    TimeUnit.SECONDS.sleep(1);
  } catch (InterruptedException e) {
    Thread.currentThread().interrupt();
    break;
  }
}
```

Thread.interrupted()

- **Start waiting methods with**

```
if (Thread.interrupted())
  throw new InterruptedException();
```

  - **Now you will always immediately leave if the thread state is interrupted.**

Javaspecialists.eu

Javaspecialists.eu

2. The Law of the Distracted Spearfisherman

Focus on one thread at a time. The *school of threads* will blind you.

*** The best defence for a fish is to swim next to a bigger, better fish.**

Law 2: Distracted Spearfisherman

- You should know each thread in your JVM
  - Good reason to have fewer threads!
- Don’t jump from thread to thread
  - Systematically work through thread dump

Javaspecialists.eu

Generating Thread Dumps

- The jstack tool dumps threads of process
  - Similar to CTRL+Break or CTRL+\
- jstack -l prints additional info about locks
- jstack -e extended listing, memory allocated per thread

Javaspecialists.eu

Javaspecialists.eu

3. The Law of the Overstocked Haberdashery

Having too many threads is bad for your application. Performance will degrade and debugging will become difficult.

*** Haberdashery: A shop selling sewing wares, e.g. threads and needles.**

Law 3: Overstocked Haberdashery

- **Story: Client-side library running on server**
- **We will answer the following questions:**
  - **How many threads can you create?**
  - **What is the limiting factor?**
  - **How can we create more threads?**

Javaspecialists.eu

Javaspecialists.eu

```
import java.util.concurrent.atomic.AtomicInteger;

public class ThreadCreationTest {
  public static void main(String... args) {
    var threads_created = new AtomicInteger(0);
    while (true) {
      new Thread() {
        public void run() {
          System.out.println("threads created: " +
            threads_created.incrementAndGet());
          synchronized (this) {
            try { wait(); }
            catch (InterruptedException e) {
              Thread.currentThread().interrupt();
            }
          }
        }
      }.start();
    }
  }
}
```

How to Create More Threads?

- We created only a few thousand threads
- A smaller stack size can help on 32-bit
  - java -Xss200k ThreadCreationTest
  - Can cause other problems
    - See The Law of the Distracted Spearfisherman
- Project Loom with Fibers will allow millions of blocking "threads"
  - Thread.sleep(), Condition.await(), Socket.read
  - However, synchronized/wait will not be supported initially

Javaspecialists.eu

Javaspecialists.eu

How Many Threads is Healthy?

- **Threads should improve performance**
- **Not too many active threads per core**
  - **Ideal is about 4, but can be between 1 and 16, depends on hardware**
- **Inactive threads**
  - **Number is architecture specific**
  - **But thousands per core is way too much**
    - **Consume memory**
    - **Can cause sudden death of the JVM**
    - **What if a few hundred threads become active suddenly?**
- ***Always make your thread pool sizes configurable***

Javaspecialists.eu

4. The Law of the Blind Spot

It is not always possible to
see what other threads (cars) are doing
with shared data (road)

Law 4: Blind Spot

- Threads can keep local copies of fields
  - Deliberately allowed by Java Memory Model
- We might not see another thread's changes
- Usually happens when we try to avoid synchronization

Javaspecialists.eu

shutdown() might have no effect

```
public class Runner {
  private boolean running = true;
  public void doJob() {
    while(running) {
      // do something
    }
  }
  public void shutdown() {
    running = false;
  }
}
```

Javaspecialists.eu

Javaspecialists.eu

Why?

- **Thread1 calls** `doJob()`
  - **makes a local copy of** `running`
- **Thread2 calls** `shutdown()`
  - **modifies field** `running`
- **Thread1 does not see the changed value of** `running` **and continues reading the local stale value**

Making Field Changes Visible

- Three ways of preventing this
  - Make field volatile
  - Make field final puts a “freeze” on value
    - Won't work if we need to change the field
  - Make read and writes to field synchronized
    - Also includes new locks

Javaspecialists.eu

Runner with "running" as **volatile**

```
public class Runner {
  private volatile boolean running = true;
  public void doJob() {
    while(running) {
      // do something
    }
  }
  public void shutdown() {
    running = false;
  }
}
```

Javaspecialists.eu

Javaspecialists.eu

5. The Law of the Leaked Memo

The JVM is allowed to reorder your statements resulting in seemingly impossible states (seen from the outside)

*** Memo about hostile takeover bid left lying in photocopy machine**

Javaspecialists.eu

Law 5: Leaked Memo

- **Two threads call f() and g()**
  - **What are the possible values of a and b ?**

```
public class EarlyWrites {
  private int x;
  private int y;
  public void f() {
    int a = x;
    y = 3;
  }
  public void g() {
    int b = y;
    x = 4;
  }
}
```

Obvious answers:
a=4, b=0
a=0, b=3

Non-obvious answer:
a=0, b=0

Extremely non-obvious answer:
a=4, b=3

The order of Things

- JMM allows reordering of statements
- Includes writing of fields
- To the writing thread, statements appear in order

Javaspecialists.eu

How to Prevent This?

- **Java can't move writes out of synchronized**
  - **Can increase the scope of synchronized**
    - **Called "lock coarsening"**
- **Keyword** volatile **prevents early writes**
  - **From the Java Memory Model:**
    - **There is a happens-before edge from a write to a volatile variable v to all subsequent reads of v by any thread (where subsequent is defined according to the synchronization order)**

Javaspecialists.eu

Javaspecialists.eu

6. The Law of the Corrupt Politician

In the absence of proper controls,
corruption is unavoidable.

*** Power tends to corrupt, and absolute power corrupts absolutely.**

Law 6: Corrupt Politician

- **Without controls, the best code can go bad**

```
public class BankAccount {
  private int balance;
  public BankAccount(int balance) {
    this.balance = balance;
  }
  public void deposit(int amount) {
    balance += amount;
  }
  public void withdraw(int amount) {
    deposit(-amount);
  }
  public int getBalance() { return balance; }
}
```

Javaspecialists.eu

What happens?

- The += operation is not atomic
  - Thread 1
    - Reads balance = 1000
    - Locally adds 100 = 1100
    - Before the balance written, Thread 1 is swapped out
  - Thread 2
    - Reads balance=1000
    - Locally subtracts 100 = 900
    - Writes 900 to the balance field
  - Thread 1
    - Writes 1100 to the balance field

Javaspecialists.eu

Javaspecialists.eu

7. The Law of the Micromanager

Even in life, it wastes effort and frustrates the other *threads*.

* *mi·cro·man·age*: **to manage or control with excessive attention to minor details.**

Law 7: Micromanager

- Thread contention is difficult to spot
- Performance does not scale
- None of the usual suspects
  - CPU
  - Disk
  - Network
  - Garbage collection
- Points to thread contention

Javaspecialists.eu

Real Example – *Don't Do This!*

- **"How to add contention 101"**
  - `String WRITE_LOCK_OBJECT = "WRITE_LOCK_OBJECT";`
- **Later on in the class**
  - `synchronized(WRITE_LOCK_OBJECT) { ... }`
- **Constant Strings are flyweights!**
  - **Multiple parts of code locking on one object**

Javaspecialists.eu

AtomicInteger

- **Thread safe without explicit locking**
- **Tries to update the value until success**
  - **AtomicInteger.equals() is not overridden**

```
public final int addAndGet(int delta) {
  for (;;) {
    int current = get();
    int next = current + delta;
    if (compareAndSet(current, next))
      return next;
  }
}
```

Javaspecialists.eu

Atomic BankAccount

```
import java.util.concurrent.atomic.AtomicInteger;

public class BankAccount {
  private final AtomicInteger balance =
    new AtomicInteger();

  public BankAccount(int balance) {
    this.balance.set(balance);
  }
  public void deposit(int amount) {
    balance.addAndGet(amount);
  }
  public void withdraw(int amount) {
    deposit(-amount);
  }
  public int getBalance() {
    return balance.intValue();
  }
}
```

8. The Law of Cretan Driving

The JVM does not enforce all the rules.
Your code is probably wrong, even if it works.

*** Don't *stop* at a stop sign if you treasure your car!**

Kolymbari Intersection

Too many signs - my head hurts!

Seems to work on my machine

Law 8: Cretan Driving

- **Learn the JVM Rules !**
  - **And obey them, even when no one else does**
- **From JSR 133 – Java Memory Model**
  - **VM implementers are encouraged to avoid splitting their 64-bit values where possible. Programmers are encouraged to declare shared 64-bit values as volatile or synchronize their programs correctly to avoid this.**

Javaspecialists.eu

JSR 133 allows this – NOT a Bug

- **Method set() called by two threads with**
  - **0x12345678ABCD0000L**
  - **0x1111111111111111L**

```
public class LongFields {
  private long value;
  public void set(long v) { value = v; }
  public long get()       { return value; }
}
```

- **Besides obvious answers, “value” could now also be**
  - **0x11111111ABCD0000L or 0x1234567811111111L**

Javaspecialists.eu

Java Virtual Machine Specification

- Gives great freedom to JVM writers
  - For running on disparate hardware
- Makes it difficult to write 100% correct Java
  - It might work on all JVMs to date, but that does not mean it is correct!
- Theory vs Practice clash

Synchronize at the Right Places

- Too much synchronization gives contention
  - With more CPUs, performance does not improve
  - The Law of the Micromanager
- Lack of synchronization leads to corrupt data
  - The Law of the Corrupt Politician
- Fields might be written early
  - The Law of the Leaked Memo

9. The Law of Sudden Riches

Additional resources (faster CPU, disk or network, more memory) for seemingly stable system can make it unstable.

*** Sudden inheritance or lottery win …**

Law 9: Sudden Riches

- **Better hardware can break system**
  - **Old system: Dual processor**
  - **New system: Dual core, dual processor**

Javaspecialists.eu

Javaspecialists.eu

Faster Hardware

- Latent defects show up more quickly
  - Instead of once a year, now once a week
  - Bug might have always been there
- Faster hardware often coincides with higher customer utilization
  - More contention
- E.g. DOM tree becomes corrupted
  - Detected problem by synchronizing all subsystem access
  - Fixed by copying the nodes whenever they were read

10. The Law of the Uneaten Lutefisk

A deadlock in Java can only be resolved by restarting the Java Virtual Machine.

* Imagine a Viking father insisting that his stubborn child eat its lutefisk before going to bed

Lutefisk

- It is not as delicious as it looks

Law 10: Uneaten Lutefisk

- Part of program stops responding
- GUI does not repaint
  - Under Swing
- Users cannot log in anymore
  - Could also be The Law of the Corrupt Politician
- Two threads want what the other has
  - And are not willing to part with what they already have

Using Multiple Locks

```
public class HappyLocker {
  private final Object lock = new Object();
  public synchronized void f() {
    synchronized(lock) {
      // do something ...
    }
  }
  public void g() {
    synchronized(lock) {
      f();
    }
  }
}
```

Finding the Deadlock

- **Press CTRL+Break, CTRL+\ or use jstack**

```
Full thread dump:
Found one Java-level deadlock:

Exercise 3.1: Repair the Doorbell

- **Did you sabotage the doorbell previously?**
  - **Let's go back and fix it**
- **Instead of group.stop(), use interrupt()**
  - **We need a volatile boolean flag in case alien code swallows the interrupt**

Exercise 3.2: Corrupt Politicians

- **This exercise should be easy!**
  - **Just don't get caught ...**
- **Taking our BankAccount**
  - **create two threads that deposit and withdraw from the same account. See how quickly you can get it to corrupt the Bank Account.**
  - **How often do you need to call deposit and withdraw before it gets corrupt?**

4: Applied Threading Techniques

Javaspecialists.eu
java training

Javaspecialists.eu

Executors

- Creating threads for small tasks is costly
  - The Law of the Overstocked Haberdashery
- Surge of traffic can make everybody slow
- Better approach is to use thread pools
- In Java we have
  - Executor and ExecutorService
  - ForkJoinPool (not covered)

ExecutorService Interface

- Tasks can be submitted as Callables
  - submit() returns a Future
    - Can then return values or throw exceptions
  - Tasks can be canceled through interruption
- Lifecycle management for threads in pool
  - We can shut it down with shutdown() or shutdownNow()
  - We can also wait for it to complete shut down with awaitTermination()
  - We can override beforeExecute(), afterExecute() and terminated() methods

Javaspecialists.eu

Javaspecialists.eu

ExecutorService

- **Callable<V> more useful than Runnable**

```
public interface Callable<V> {
  V call() throws Exception;
}
```

- **submit(Callable<V>) returns a Future<V>**

```
public interface Future<V> {
  boolean cancel(boolean mayInterruptIfRunning);
  boolean isCancelled();
  boolean isDone();
  V get() throws InterruptedException, ExecutionException;
  V get(long timeout, TimeUnit unit)
    throws InterruptedException, ExecutionException,
           TimeoutException;
}
```

          }
          return total * 10000 + submitOrder;
        }
      }));
    }
    for (Future<Long> future : futures) {

main thread

executor threads

Future results are retrieved in the order the jobs were submitted, not in the order they were completed

Javaspecialists.eu

Types of ExecutorService

- **Create with Executors Facade**
  - **Executors.newFixedThreadPool()**
    - **Keeps a permanent total number of threads**
    - **Threads are not started until we start submitting jobs - why?**
  - **Executors.newSingleThreadExecutor()**
    - **Like a FixedThreadPool, but with only one thread**
  - **Executors.newCachedThreadPool()**
    - **Creates new threads as needed and destroys old threads**
  - **Executors.newScheduledThreadPool()**
    - **Should be used instead of Timer**
  - **Executors.newSingleThreadScheduledExecutor()**
    - **Very similar to the java.util.Timer class**

Javaspecialists.eu

CompletionService

- Returns results in order that they complete
- CompletionService wraps ExecutorService
- CompletionService is parameterized with generics
  - Should only be used with one type of Callable

Javaspecialists.eu

```
import java.util.concurrent.*;

public class CompletionServiceTest {
  public static void main(String... args) throws Exception {
    int poolSize = Runtime.getRuntime().availableProcessors() * 4;

    for (int i = 0; i < poolSize * 3; i++) {
      int submitOrder = i;
      service.submit(new Callable<Long>() {
        public Long call() throws Exception {
          var r = ThreadLocalRandom.current();
          long total = 0;
          for (int i = 0; i < 10000000; i++) {

      });
    }

Semaphore

- The “bouncer” of Java concurrency
  - Limits resources to specified number
  - Has no knowledge of who has acquired permits
- We acquire the semaphore with the `acquire()` method
- We release it again with the `release()` method

Javaspecialists.eu

```
import java.util.concurrent.*;
public class SemaphoreTest {
  public static void main(String... args) throws Exception {
    var time = System.currentTimeMillis();
    var bouncer = new Semaphore(25);
    var pool = Executors.newCachedThreadPool();
    for (int i = 0; i < 100; i++) {
      pool.execute(() -> {
        try {
          bouncer.acquire();
          try {
            Thread.sleep(1000);
          } finally {
            bouncer.release();
          }
        } catch (InterruptedException e) {
          Thread.currentThread().interrupt();
          return;
        }
      });
    }
    pool.shutdown();
    pool.awaitTermination(10, TimeUnit.SECONDS);
    time = System.currentTimeMillis() - time;
    System.out.println(time + "ms");
  }
}

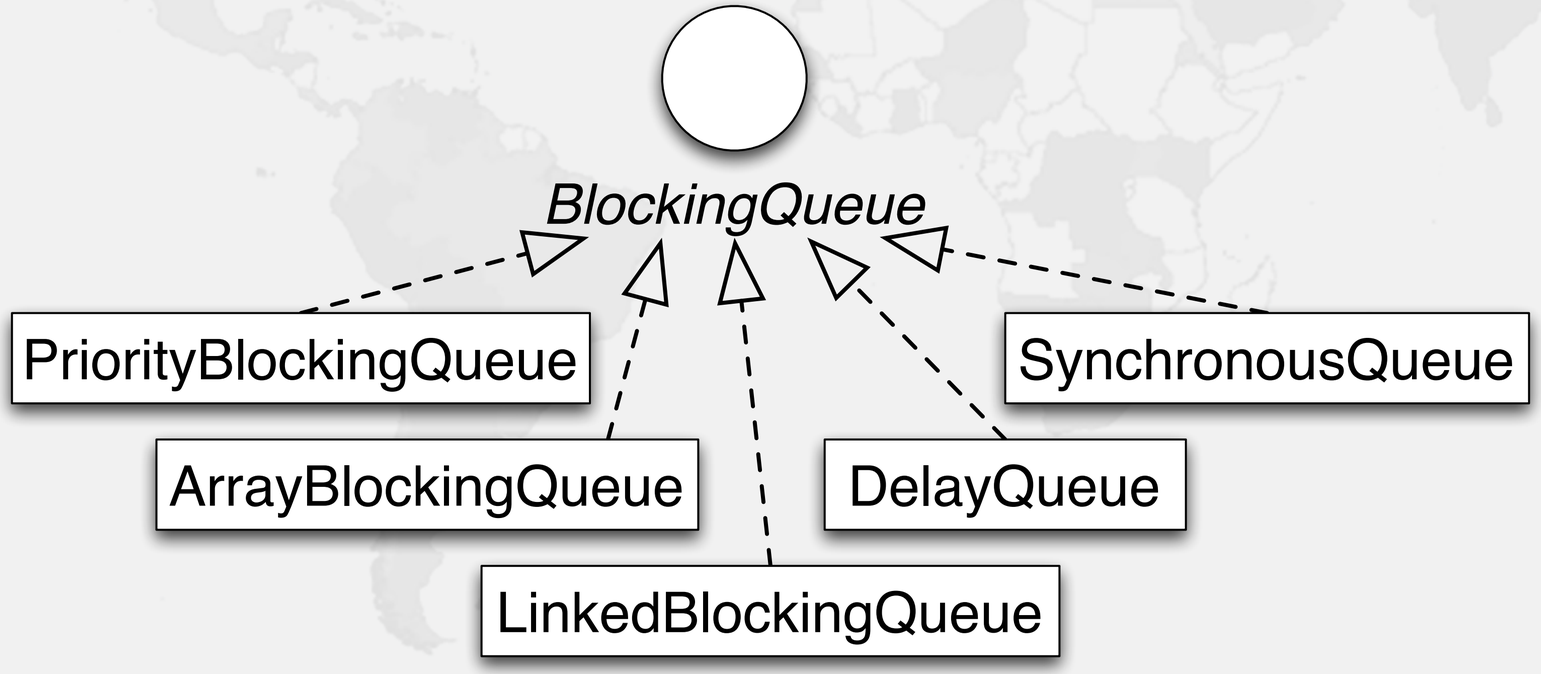
Javaspecialists.eu

BlockingQueues

- **Extension of Queue interface**
- **Can block on removing or adding**



Javaspecialists.eu

BlockingQueue Methods

- `put()` **adds elements into queue**
  - **Blocks if queue is full**
- `take()` **removes front of queue**
  - **Blocks if queue is empty**
- **Functions above throw** `InterruptedException`
- **This is used in Producer/Consumer scenarios**

Javaspecialists.eu

ArrayBlockingQueue

- Blocking queue based on an array
  - Circular structure with head that moves
- Fixed length – size of array
- Most memory efficient blocking queue
- Single lock for put() and take()
  - SPSC usage can be slower than LinkedBlockingQueue

Javaspecialists.eu

LinkedBlockingQueue

- Blocking queue based on a linked list
- Maximum length is unbounded by default
  - You can specify a maximum length
- One lock for put() and another for take()
  - But memory layout and node sizes makes it slower than ArrayBlockingQueue

Javaspecialists.eu

PriorityBlockingQueue

- **Returns elements using natural order**
  - **Can be overridden with `java.util.Comparator`**
- **Smallest element returned by `take()`**
- **Iterator does not return ordered list**
  - **You should not iterate over queues anyway**
- **Sort order is not stable**

Javaspecialists.eu

DelayQueue

- **Similar to** `PriorityBlockingQueue`
- `take()` **returns items once delay is elapsed**
- **Takes** `java.util.concurrent.Delayed` **objects**

Javaspecialists.eu

SynchronousQueue

- **Has a size of zero!**
- `put()` **and** `take()` **both block**
- **Don't confuse synchronous with synchronized**
  - **Synchronous as opposed to asynchronous**

Javaspecialists.eu

Exceptions

- **Pre-Java 5, uncaught exceptions got lost**
  - **www.javaspecialists.eu/archive/Issue089.html**
- **For example:**

```
public class ExceptionHandling {
  public static void main(String... args) {
    var thread = new Thread() {
      public void run() {
        throw new RuntimeException();
      }
    };
    thread.start();
  }
}
```

```
Exception in thread "Thread-0" java.lang.RuntimeException
        at ExceptionHandling$1.run(ExceptionHandling.java:7)
```

Javaspecialists.eu

Handling Uncaught Exceptions

- `Thread.UncaughtExceptionHandler`
  - **Can be per-Thread or global**
- **Implement method** `uncaughtException()`
- **From Exception Handler, you can send error report**
  - **Better to know you have a problem**

```
public class SimpleExceptionHandler
    implements Thread.UncaughtExceptionHandler {
  public void uncaughtException(Thread t, Throwable e) {
    StackTraceElement ste = e.getStackTrace()[0];
    System.err.printf("%s: %s at line %d of %s%n",
      t.getName(), e, ste.getLineNumber(),
      ste.getFileName());
  }
}
```

Setting the Uncaught Handler

- **Use thread.setUncaughtExceptionHandler()**

```
public class ExceptionHandling2 {
  public static void main(String... args) {
    var thread = new Thread() {
      public void run() {
        throw new RuntimeException();
      }
    };
    thread.setUncaughtExceptionHandler(new SimpleExceptionHandler());
    thread.start();
  }
}
```

```
Thread-0: java.lang.RuntimeException at line 7 of ExceptionHandling2.java
```

Javaspecialists.eu

ThreadGroup Exception Handling

- **Pre-Java 5 approach**
- **Subclass ThreadGroup and override**

```
public void uncaughtException(Thread t, Throwable e);
```

- **Make the new ThreadGroup the container for all of your threads**

Javaspecialists.eu

Thread Local

- Associate state with a thread
  - e.g. user or Transaction ID
- Each thread has a map of its ThreadLocals
  - Once thread stops, all its ThreadLocals are released

Javaspecialists.eu

Example of ThreadLocal

- **Create a unique ID for each thread**

```
public class UniqueThreadIdGenerator {
  private static final AtomicInteger nextId =
    new AtomicInteger(0);
  private static final ThreadLocal<Integer> threadId =
    ThreadLocal.withInitial(() -> nextId.getAndIncrement());

  public static int getCurrentThreadId() {
    return threadId.get();
  }
}
```

Javaspecialists.eu

Stopping Threads

- `Thread.stop()` **is deprecated**
  - **Can result in broken invariants**
  - **Inconsistent state**
  - **May cause deadlocks**
- `stop()` **causes an asynchronous exception**
  - **Can stop you in the middle of a critical piece of code**
- **Instead, use the interrupt command and cooperative shutdown**

Javaspecialists.eu

Javaspecialists.eu

Shutdown Hooks

- **Code to be executed when JVM shuts down**
  - **When the last non-daemon thread finishes**
  - **Or when `System.exit()` is called**
- **Shutdown hook tasks are specified as threads**
  - `Runtime.getRuntime().addShutdownHook(Thread)`
  - **Can be executed in any order**
- **Once all the shutdown hooks have completed, `halt()` is called**
  - **You can bypass the shutdown hooks by calling `halt()` directly**
  - `Runtime.getRuntime().halt(0);`

Javaspecialists.eu

Shutdown Hook Example

```
import java.io.*;

public class ShutdownHookExample {
  public static void main(String... args)
      throws IOException {
    var out1 = new PrintWriter(
      new FileWriter("test1.txt"), false); // auto-flush off
    out1.println("This will not be in test1.txt file!");

    var out2 = new PrintWriter(
      new FileWriter("test2.txt"), false); // auto-flush off
    Runtime.getRuntime().addShutdownHook(new Thread(out2::close));
    out2.println("This will be in the test2.txt file!");
  }
}
```

Javaspecialists.eu

Exercise 4.2: ExecutorService

- **Delegate to ExecutorService in ThreadPool**

Javaspecialists.eu

Javaspecialists.eu

Exercise 4.3: Dining Philosophers

- **Problem description**
  - Thanks Marco Tedone for letting us use his code
  - We know the typical "dining philosopher" problem
    - Each philosopher has two forks, each of which is shared with an adjacent philosopher. The philosopher is either thinking, hungry or eating. In order to eat, he has to pick up both forks.
  - The challenge is to avoid a deadlock. If every philosopher first picks up the right fork, then they could all sit there holding a single fork since the left fork has been picked up by the person on his left.
  - This code appears to be correct, but there is one little problem that causes two adjacent philosophers to eat at the same time. Fix it. (Good luck!)

Javaspecialists.eu

Exercise 4.4: ThreadLocal

- We can call methods inside constructors
  - Even *abstract* methods!
  - The most derived method is invoked
  - However, the subclass constructor has not been called yet
- Try and work around this by using ThreadLocal in the subclass
  - Hint: only works if the superclass constructor takes at least one parameter

Race Conditions

- **Output is dependent on timing of events**
  - **Occurs in poorly-designed electronics systems**
  - **Also in *multithreaded or distributed programs***

Javaspecialists.eu

Example of Simple Race Condition

```
// result is unpredictable

public class RaceConditionExample {
  private static long count = 0;

  public static void main(String... args) throws Exception {
    Runnable task = () -> {
      for (int i = 0; i < 100_000_000; i++) count++;
    };
    var threads = new Thread[5];
    for (int i = 0; i < threads.length; i++) {
      threads[i] = new Thread(task);
      threads[i].start();
    }
    for (var thread : threads) {
      thread.join();
    }
    System.out.println("count = " + count);
  }
}
```

204068911

Javaspecialists.eu

Javaspecialists.eu

Fixed with LongAdder

```
import java.util.concurrent.atomic.*;

public class RaceConditionExampleFixed {
  private static LongAdder count = new LongAdder();

  public static void main(String... args) throws Exception {
    Runnable task = () -> {
      for (int i = 0; i < 100_000_000; i++) count.increment();
    };
    var threads = new Thread[5];
    for (int i = 0; i < threads.length; i++) {
      threads[i] = new Thread(task);
      threads[i].start();
    }
    for (var thread : threads) {
      thread.join();
    }
    System.out.println("count = " + count);
  }
}
```

```
500000000
```

Lazy Initialization Race Conditions

- **Be careful when creating objects lazily**
  - **Might create several map objects**
  - **Also, HashMap is not thread-safe**

```
import java.util.*;

public class LazyInitializationRaceCondition {
  private Map<String, String> map;

  public String getName(String id) {
    if (map == null) map = new HashMap<>();
    return map.get(id);
  }

  public void putName(String id, String name) {
    if (map == null) map = new HashMap<>();
    map.put(id, name);
  }
}
```

Javaspecialists.eu

ConcurrentHashMap

- **Never use plain HashMap**
  - **Even if you do not need it, use the concurrent map**

```
import java.util.*;
import java.util.concurrent.*;

public class LazyInitializationRaceConditionFixed {
  private final Map<String, String> map = new ConcurrentHashMap<>();

  public String getName(String id) {
    return map.get(id);
  }

  public void putName(String id, String name) {
    map.put(id, name);
  }
}
```

Javaspecialists.eu

How to Detect Race Conditions?

- **Can be extremely difficult to detect**
  - **Happens with *check-then-act* constructs**
    - **Out-of-date information leads to wrong decisions**
  - **Often undetected until the system runs on faster server (The Law of Sudden Riches) or meets production load**
- **Look for clues: corrupt data, threads stuck waiting for signals**
- **Make sure that synchronization is correct!**

Javaspecialists.eu

Javaspecialists.eu

Starvation

- Thread perpetually denied resources
  - Can cause OutOfMemoryError
  - Can prevent program from ever completing
- Most common situation is when some low priority thread is ignored for long periods of time, preventing it from ever finishing work
- In Java, thread priorities are just a hint for the operating system. The mapping to system priorities is system dependent
- Tweaking thread priorities might result in starvation

Javaspecialists.eu

ReadWriteLock Starvation

- Starvation can happen with ReadWriteLock
  - In Java 5, readers could tag-team each other
    - Lots of readers would starve the writers
  - Since Java 6, readers can be starved if we have a single reader thread and lots of writers
- Similar starvation may occur with StampedLock
  - Best to use optimistic reads to avoid starving the writers
- Only use ReadWriteLock when you are sure that you will not continuously be acquiring locks

Detecting Thread Starvation

- **Part of the system is not performing well**
- **Look for threads with different priorities**
  - **Thread dump with `jstack`**
  - **Note that Linux / Mac OS X gives all threads the same OS priority**
- **Look for `Thread.yield()` and `Thread.sleep()` in odd places**

Fairness

- Java locking mechanisms are not fair
  - One thread could get a lock repeatedly
  - Not the same as unfair
- The operating system allocates time round-robin, thus fairness is not necessary to enforce in Java
- Critical sections should always be as short as possible

Javaspecialists.eu

Javaspecialists.eu

Making Java Locks Fair

- **ReentrantLocks should not be made fair**
  - **There is significant cost in managing fairness**

Deadlock

- Usually several threads blocking each other
  - But deadlock can happen with just one thread
- Happens in these scenarios
  - Two threads acquiring two locks in different orders
  - Alien method calls whilst holding a lock
  - ReentrantLock that we do not unlock
  - Upgrades from ReadLock to WriteLock
  - Threads trying to access static methods of classes being loaded
  - Bounded resources deadlocking due to capacity being reached

Javaspecialists.eu

```
// this class can cause deadlock if f() and g()
// are called by two threads
public class HappyLocker {
  private final Object lock = new Object();
  // a Thread that calls f() first acquires this
  // and then lock
  public synchronized void f() {
    synchronized(lock) {
      // do something ...
    }
  }
  // a Thread that calls g() first acquires lock
  // and then this through f()
  public void g() {
    synchronized(lock) {
      f();
    }
  }
}
```

Javaspecialists.eu

```
public class DeadlockExample {
  public static void main(String... args) {
    int UPTO = Integer.parseInt(args[0]);
    var pc = new HappyLocker();
    var fcaller = new Thread(() -> {
      for (int i = 0; i < UPTO; i++) pc.f();
      System.out.println("No deadlock");
    }, "f()");
    var gcaller = new Thread(() -> {
      for (int i = 0; i < UPTO; i++) pc.g();
    }, "g()");
    fcaller.start();
    gcaller.start();
  }
}
```

On a Single-Core Machine

```
> java DeadlockExample 10000

No deadlock

> java DeadlockExample 1000000

No deadlock

> java DeadlockExample 10000000
```

(no output – we suspect a deadlock)

How can we find deadlocks?

- **Always visible in the thread dump**
  - **Generate with Ctrl+Break or Ctrl+\ or jstack**
  - **Some deadlocks are explicitly shown in dump**
- **When you suspect a deadlock:**
  - **Try and have the deadlock reproduced in a short period of time, i.e. program should not run 5 days before deadlock appears**
  - **When deadlock seems to appear, press CTRL+Break**
  - **Follow the thread stack trace to see if more than one lock is involved**

jstack Output

```
Full thread dump OpenJDK 64-Bit Server VM (11+28 mixed mode):

Found one Java-level deadlock:

"f()":
  waiting to lock monitor 0x80d100 (object 0xee7c40, a java.lang.Object),
  which is held by "g()"
"g()":

Livelock

- Thread keeps on retrying a failing operation
  - Usually due to an unrecoverable error
  - Exceptions not handled correctly, etc.

Example – Spot the LiveLock

```
public void assign(Container container) {
  synchronized (lock) {
    PooledThread thread = null;
    do {
      while (this.idle.isEmpty()) {
        try {
          lock.wait();
        } catch (InterruptedException ie) {
          Thread.currentThread().interrupt();
        }
      }
      if (!this.idle.isEmpty())
        thread = this.idle.getFirst();
    } while ((thread==null) || (!thread.isRunning()));
    this.moveToRunning(thread);
    thread.start(container);
    lock.notify();
  }
}
```

Exercise 5.1: What Can Happen?

```
public class PrinterClass {
  private static final boolean OUTPUT_TO_SCREEN = false;
  private boolean printingEnabled = OUTPUT_TO_SCREEN;

  public synchronized boolean isPrintingEnabled() {
    return printingEnabled;
  }
  public void print(String s) {
    print(this, s);
  }
  private synchronized static void print(PrinterClass pc, String s) {
    if (pc.isPrintingEnabled()) {
      System.out.println("Printing: " + s);
    }
  }
  public synchronized void setPrintingEnabled(boolean printingEnabled) {
    if (!printingEnabled) {
      print(this, "Printing turned off!");
    }
    this.printingEnabled = printingEnabled;
  }
}
```

Write code to demonstrate the problem

Exercise 5.2: Respond to Bala

- **Here is the email that I received from Bala**
  - **Discovered a bug in ThreadLocal**
  - **Hi Heinz,**
    I am writing this mail as i am getting null values randomly in ThreadLocal get when using HashMap as threadlocal value. The code and results are attached and i used Java1.4 and 1.5 (Sun Java). I taught you might have an answer already or you will be interested in finding one.

    I guess i need not explain about the code much as these are simple classes and the main class is ProcessTaskCaller

    I am setting a for a threadlocal in a thread and accessing the value in a different class (I am trying to access additional values in the ProcessTaskProxy class that are not passed via method)
    Thanks and Regards
    Bala
